Roman Coin (Denarius)

The SciArt Project
2024

Results Report

Point of Interest 1: Main body of the coin, collected from the edge

We are studying the sample we collected from the main body of the coin, from its edge.

In the image we obtain from the SEM, we observe the surface morphology of the coin. The surface is rough, which is an indication of wear. We cannot obtain any additional information.

Point of Interest 2: Relief

In the SEM image of the traces we spotted on the relief of the coin we do not observe any information about the type of material, except for the fact that the traces look like tiny grains.
